Mini Project on Speech Processing Using MATLAB

Speech processing is a fascinating area within digital signal processing that involves the analysis, synthesis, and recognition of human speech signals. With advancements in technology, MATLAB has emerged as a popular tool for developing speech processing applications due to its robust signal processing toolbox, ease of use, and comprehensive simulation environment. This article provides an in-depth guide on creating a mini project on speech processing using MATLAB, covering essential concepts, step-by-step procedures, and implementation tips to help beginners and intermediate users develop effective speech processing applications.

Introduction to Speech Processing

Speech processing encompasses various techniques aimed at analyzing and manipulating speech signals for applications such as speech recognition, speaker identification, noise reduction, and speech synthesis. The core idea involves converting analog speech signals into digital form, processing them through algorithms, and then interpreting or synthesizing speech as needed.

Why Use MATLAB for Speech Processing?

MATLAB offers several advantages for speech processing projects:

- **Rich Toolboxes:** MATLAB's Signal Processing Toolbox simplifies tasks like filtering, Fourier analysis, and spectral analysis.
- **Ease of Visualization:** Built-in plotting functions allow for real-time visualization of signals and processing results.
- **Simulation Environment:** MATLAB provides a flexible environment for testing algorithms without requiring hardware implementation.
- **Community and Resources:** Extensive user community and tutorials facilitate troubleshooting and learning.

Core Components of the Mini Project

The mini project typically involves the following stages:

- **Data Acquisition:** Recording or importing speech signals.
- **Preprocessing:** Noise removal, normalization, and framing.
- **Feature Extraction:** Deriving meaningful features like MFCC or LPC coefficients.
- **Speech Recognition or Classification:** Using features for recognizing spoken words or speaker identification.
- **Post-processing and Visualization:** Presenting results and refining the process.

This guide focuses on creating a simple speech recognition system using feature extraction and pattern matching.

Step-by-Step Guide to Developing the Mini Project

1. Setting Up MATLAB Environment

Begin by installing MATLAB and ensuring the Signal Processing Toolbox is available. Create a new script or live script for your project.

2. Data Collection and Import

You can record speech directly using MATLAB or import existing audio files (.wav format). For example:

```
```matlab

[audioln, fs] = audioread('sample_speech.wav');

sound(audioln, fs);

```
```

Ensure audio files are mono and of sufficient quality for analysis.

3. Preprocessing

Preprocessing enhances the quality of speech signals and prepares data for feature extraction.

- **Noise Removal:** Apply filters like low-pass or band-pass filters to eliminate unwanted noise.
- **Normalization:** Adjust the amplitude to a standard level.
- **Framing:** Divide the speech signal into overlapping frames to analyze short-time features.

Example code for framing:

```
```matlab

frameSize = 256; % in samples

overlap = 128; % in samples

frames = buffer(audioln, frameSize, overlap, 'nodelay');

```
```

4. Feature Extraction

Feature extraction captures the essential characteristics of speech signals. Common features include Mel-Frequency Cepstral Coefficients (MFCC), Linear Predictive Coding (LPC), and Spectral features.

MFCC Extraction Example:

```
```matlab

% Use MATLAB's built-in mfcc function (requires Audio Toolbox)

coeffs = mfcc(audioln, fs);

plot(coeffs);

title('MFCC Features');

```
```

This process involves:

- Windowing each frame
- Applying Fourier Transform
- Mapping to Mel scale
- Applying Discrete Cosine Transform

LPC Extraction Example:

```
```matlab
```

```
order = 12; % LPC order
```

```
lpcCoeffs = lpc(audioIn, order);
```

```
```
```

5. Pattern Matching and Recognition

Once features are extracted, implement a simple classifier such as Euclidean distance matching or a pre-trained neural network for recognizing speech.

Example: Euclidean Distance Matching

Suppose you have stored feature vectors for known words:

```
```matlab
```

```
% Known feature vectors
```

```
knownFeatures = [featureVector1; featureVector2; featureVector3];
```

```
% New feature vector
```

```
newFeature = mean(coeffs, 1);
```

```
% Calculate distances
```

```
distances = sqrt(sum((knownFeatures - newFeature).^2, 2));
```

```
% Find the closest match
```

```
[~, index] = min(distances);
```

```
disp(['Recognized Word: ', knownWords{index}]);
```

```
```
```

For more advanced recognition, consider using MATLAB's Pattern Recognition Toolbox or machine learning classifiers like SVM or neural networks.

Visualizing Results

Visualization helps interpret speech signals and processing results:

- Waveform plots for raw and processed signals.
- Spectrograms for time-frequency analysis.
- Feature plots such as MFCC coefficient trajectories.

Example of spectrogram:

```
```matlab

spectrogram(audioIn, hamming(256), 128, 256, fs, 'yaxis');

title('Spectrogram of Speech Signal');

```
```

Enhancements and Advanced Features

- Noise Robustness: Implement noise reduction algorithms like spectral subtraction.
- Real-time Processing: Use MATLAB's app designer or Simulink for real-time speech analysis.

Advantages of MATLAB in Speech Processing:

- Rich library of signal processing functions
- Easy-to-use graphical interface and plotting tools
- Support for audio file handling
- Rapid prototyping and algorithm development
- Compatibility with hardware for real-time processing (via MATLAB Support Packages)

Core Components of the Mini Project

The mini project generally encompasses several stages:

- Data Collection and Preprocessing
- Feature Extraction
- Classification or Recognition (optional)
- Speech Synthesis or Modification (optional)

Below, each component is discussed in detail.

1. Data Collection and Preprocessing

Objective: Capture or load speech signals and prepare them for analysis.

Steps:

- Data Acquisition:
 - Record speech using MATLAB's `audiorecorder` function.
 - Alternatively, load existing speech files (`.wav` format) using `audioread`.

- Preprocessing:

- Normalization: Adjust amplitude levels for uniformity.
- Noise Removal: Apply filters (e.g., low-pass, high-pass, band-pass) to eliminate background noise.
- Silence Removal: Detect and remove silent segments for efficiency.
- Segmentation: Divide continuous speech into frames (~20-30 ms) for analysis.

Example MATLAB Code Snippet:

```
```matlab

% Load speech file

[signal, Fs] = audioread('speech.wav');

% Normalize the signal

signal = signal / max(abs(signal));

% Apply bandpass filter (e.g., 300Hz to 3400Hz for speech)

bpFilt = designfilt('bandpassiir','FilterOrder',20, ...

'HalfPowerFrequency1',300,'HalfPowerFrequency2',3400, ...

'SampleRate',Fs);

filtered_signal = filtfilt(bpFilt, signal);

```
```

2. Feature Extraction

Objective: Derive meaningful features from speech signals that can distinguish different phonemes, speakers, or spoken words.

Common Features:

- Time Domain Features: Zero Crossing Rate (ZCR), Short-Time Energy
- Frequency Domain Features: Spectral Centroid, Spectral Roll-off
- Cepstral Features: Mel-Frequency Cepstral Coefficients (MFCCs), Linear Predictive Coding (LPC)

Why MFCCs?

MFCCs are widely used because they closely model human auditory perception and provide robust features for speech recognition.

Implementation Steps:

- Divide the speech signal into overlapping frames.
- Apply windowing (e.g., Hamming window) to each frame.
- Compute the Fourier Transform to get the spectrum.
- Map the spectrum onto the Mel scale.
- Take the logarithm of the Mel spectrum.
- Apply Discrete Cosine Transform (DCT) to decorrelate the coefficients.
- Select the first few coefficients as features.

Sample MATLAB Implementation:

```
```matlab
```

```
frameSize = 256; % Frame size in samples
```

```
overlap = 128; % 50% overlap
```

```
window = hamming(frameSize);
```

```
% Frame blocking
```

```
frames = buffer(filtered_signal, frameSize, overlap, 'nodelay');
```

```
numFrames = size(frames, 2);
```

```
MFCCs = [];
```

```
for i = 1:numFrames
```

```
frame = frames(:, i) . window;
```

```
spectrum = fft(frame);
```

```
magSpectrum = abs(spectrum(1:frameSize/2+1));
```

```
% Mel filter bank processing (using MATLAB's mfcc function)
```

```
coeffs = mfcc(magSpectrum, Fs);
```

```
MFCCs = [MFCCs; coeffs'];
```

```
end
```

...

### 3. Speech Recognition or Classification (Optional)

Approach:

- Use classifiers such as K-Nearest Neighbors (KNN), Support Vector Machines (SVM), or Neural Networks.
- Train the classifier on labeled feature data.
- Evaluate the classifier's accuracy on test data.

Basic Workflow:

- Collect labeled data for different categories.
- Extract features for each sample.
- Train the classifier.
- Test the classifier on unseen data.

Sample MATLAB Code for SVM:

```
```matlab

% Assume features and labels are stored in 'features' and 'labels'

SVMModel = fitsvm(features, labels, 'KernelFunction', 'linear');

% Prediction

predictedLabels = predict(SVMModel, testFeatures);

accuracy = sum(strcmp(predictedLabels, testLabels)) / length(testLabels) 100;

disp(['Recognition Accuracy: ', num2str(accuracy), '%']);

...

```

4. Speech Synthesis and Modification (Optional)

Objective: Generate speech from text or modify existing speech signals.

Techniques:

- Use MATLAB's `speechsynth` or third-party toolboxes.
- Implement pitch shifting, time scaling, or voice conversion.

Example:

```
```matlab
```

```
% Simple pitch shifting
```

```
shiftedSpeech = pitchShift(filtered_signal, Fs, 1.2); % 20% pitch increase
```

```
sound(shiftedSpeech, Fs);
```

```
```
```
