Understanding Long Division: The Basics

What Is Long Division?

Long division is a method used to divide large numbers that cannot be easily divided mentally. It involves breaking down the division process into manageable steps, making it easier to find the quotient and the remainder. This method is foundational for mastering more advanced mathematical concepts, such as polynomial division and algebra.

Key Components of Long Division

To understand how to perform long division, it's important to familiarize yourself with its key components:

- Dividend: The number being divided.
- Divisor: The number you are dividing by.
- Quotient: The result of the division.
- Remainder: The leftover part after division.

The Long Division Algorithm

The process involves:

- Dividing the first digit or group of digits of the dividend by the divisor.
- Writing the result (the quotient digit) above the division bar.

- Multiplying the divisor by this quotient digit.
- Subtracting the result from the chosen digits of the dividend.
- Bringing down the next digit and repeating the process until all digits are processed.

Step-by-Step Guide to Using Long Division with Kuta Software

- Setting Up the Problem

Begin with the division problem you wish to solve. For example, divide 987 by 23.

- Understand the Components

Break down the problem into components:

- Dividend: The number being divided (987).
- Divisor: The number you are dividing by (23).
- Quotient: The answer you are seeking.
- Remainder: What's left after division if it doesn't divide evenly.

- Divide the First Digits

- Look at the leading digits of the dividend to see how many times the divisor can fit.
- For 987 divided by 23:
 - The first two digits, 98, are considered.
 - How many times does 23 go into 98?
 - $23 \times 4 = 92$.
 - $23 \times 5 = 115$ (which is too large).

- Write the First Quotient Digit

- Since $23 \times 4 = 92$, write 4 above the third digit of the dividend (the 7 in 987).

- Multiply and Subtract

- Multiply divisor by the quotient digit: $23 \times 4 = 92$.
- Subtract 92 from 98: $98 - 92 = 6$.

- Bring Down the Next Digit

- Bring down the next digit of the dividend (the 7), making the new number 67.

- Repeat the Process

- How many times does 23 go into 67?
- $23 \times 2 = 46$.
- $23 \times 3 = 69$ (too large).
- Write 2 above the next digit.

- Multiply: $23 \times 2 = 46$.
- Subtract: $67 - 46 = 21$.

- Continue Until Completion

- Bring down any remaining digits, if any.
- Continue dividing, multiplying, subtracting, and bringing down.
- If the last subtraction leaves a number smaller than the divisor, that is the remainder.

- Final Result

- Combining the quotient digits gives 42 with a remainder of 21.
- Expressed as: 42 R21 or as a decimal, $42 + 21/23 \approx 42.913$.
